Let's learn how to draw a Venom GT, regarded by many as the fastest production car in the world, reaching speeds of nearly 270 mph. That's really fast!

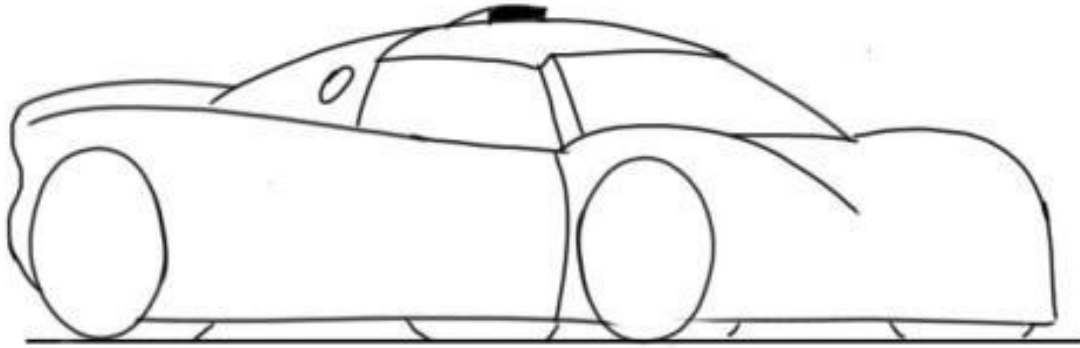

First the easiest step: the wheels. It doesn't need much explaining.

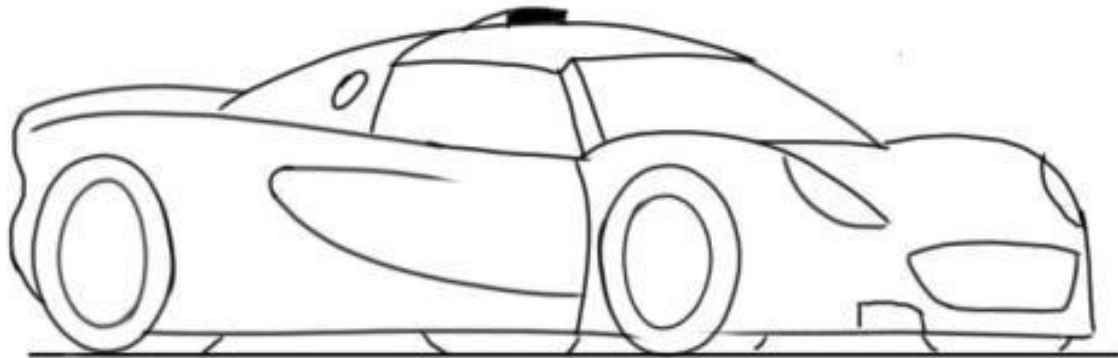

Next draw the body. The wheel housings at the front are very noticeable so make them stand out. The vertical line behind the front wheel is a vent to let the out hot air from the brakes and also reduce turbulent air that could lift the car up. Obviously that's not desirable.

Now draw the cabin, which I think looks really cool because it doesn't go all the way to the back of the car. Very a la Pagani. Then, draw the rear wing.

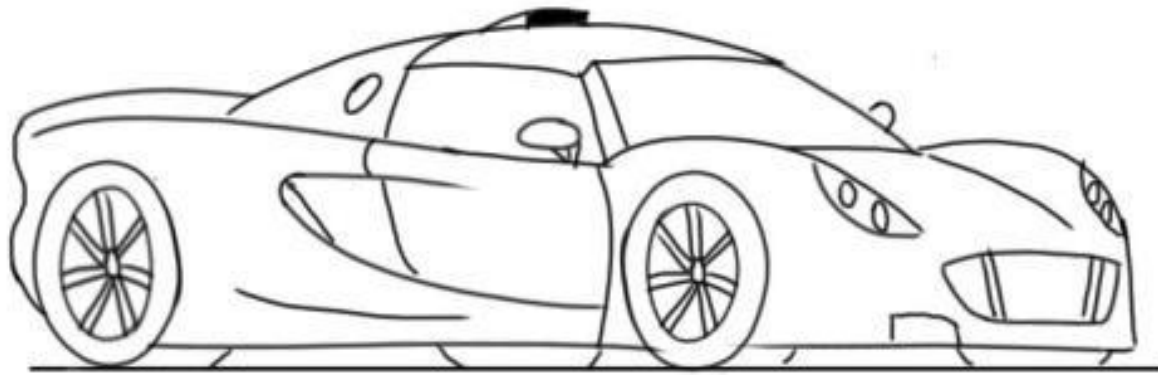

The fourth step is to draw the windows and some details. Notice the cut-lines on the roof, this is because all Venom GTs can have their top removed. Just behind the removable top goes a small scoop and lastly, draw the fuel cap.

After that draw some more details. Stuff like the side intake, headlights, front grill and intake.

At this point, does the car look familiar to you? I mean, evidently it looks like a Venom GT, but no, that's not it. Maybe it looks familiar because this car is based on a Lotus Elise, albeit with some modifications.

Draw also the guides for the rims inside the wheels.

In this last step draw the rim spokes, the door, side mirrors, the lamps in the headlights and the grill detail, which is minimum. I hope you like this tutorial.
